Scalability & Future Plan

Student: Pravesh Singh **Project:** Electric Vehicle Market Performance & Insights
Date: 1 November 2026 **Team:** Individual Project

Current system limitations

• The solution is a Tableau dashboard built from the supplied CSV dataset.

• Coverage, freshness, completeness, and consistency limit conclusions.

• The workbook provides descriptive analysis; validated forecasting and automatic live refresh are not implemented.

• Performance under multiple concurrent users has not been load-tested.

Scalability plan

• Retain the source CSV and packaged workbook; consider a governed database if data volume grows.

• Document the refresh process and automate only if the source and platform support it.

• Optimize calculations and marks, then measure dashboard responsiveness.

• Publish only permitted data and never embed credentials.

Future roadmap

• Phase 2: add verified regional EV sales and charging-infrastructure data.

• Phase 3: add validated forecasting and scenario comparisons.

• Phase 4: add lifecycle-emissions metrics, scheduled refresh, and user feedback.

• Phase 5: evaluate usability and performance with additional users.

Implemented: eight worksheets, two dashboards, navigation buttons, Tableau Public publication, and a saved .twbx workbook.
