Problem–Solution Fit

Student: Pravesh Singh **Project:** Electric Vehicle Market Performance & Insights
Date: 1 November 2026 **Team:** Individual Project

Customer segments

Potential users include EV market strategy professionals, automotive business-intelligence analysts, and sustainable-mobility researchers. These are intended user profiles, not interviewed or verified customers.

Customer problem

EV indicators such as manufacturer performance, annual sales, battery technologies, capacity, degradation, cycle life, and customer ratings can be difficult to compare when viewed separately.

Proposed solution

A Tableau dashboard organizing available EV market measures into eight charts across two dashboards, with navigation between them.

Why the solution fits

The dashboard brings related indicators into one exploration workflow, subject to the supplied dataset's coverage.

Assumptions to validate

- Dataset coverage is sufficiently representative and current.
- Units and category labels are consistent and comparable.
- Sales totals and aggregations are calculated correctly.
- Customer ratings are comparable across included records.
- Users can understand chart titles, labels, and navigation.

Validation plan

- Reconcile chart values with the source dataset.
- Test dashboard navigation and available interactive controls.
- Inspect missing values, duplicates, and inconsistent labels.
- Collect instructor or representative-user feedback, if available.

Success measures

Eight worksheets are present, both dashboards open, navigation works, the workbook is published, and displayed figures can be reconciled to source data. Add user feedback and performance results only after collecting them.
